

Abstract

This paper presents a novel approach to image classification using transformer-based architectures.

1. Introduction

Deep learning has revolutionized computer vision. In recent years, transformer models have shown remarkable

2. Methods

We propose a Vision Transformer (ViT) that splits images into patches and processes them with a standard

3. Results

Our model achieves 95% accuracy on ImageNet, outperforming previous CNN-based methods by 3%. The

4. Discussion

The results demonstrate that transformer architectures can effectively process image data. However, the mo

5. Conclusion

We presented a Vision Transformer for image classification. Future work includes exploring multi-scale arch
